DI Validation: Vet and Validate for Peace of Mind

Digital Intermediate (DI) files are the caretakers of a great wealth of valuable information. However, before archiving is considered to be complete, these files need support in the form of **DI Validation**.

This intervention gives you the peace of mind that your archives are solid, by assuring that the files match the studio specs, that all files are included, and that the sets of files remain consistent across each version.

When it comes to DI Validation, our clients trust us to be thorough – and we deliver.

Our team of experts carefully **vet and validate** your newly-created and recently-archived DI DSM, DCDM, and DCP files.

We start by loading all the file contents from the LTO archive to our secure servers. We **vet** the contents; carefully checking each set of completed DI files to verify that all files are present on the LTO and that they do in fact match their labels.

Then we **validate** that the files are true to their characteristics; confirming that all the components – format, file size, color space, frames, etc. – consistently conform throughout all versions. This is where we catch and correct issues such as missing frames, color discrepancies, etc.

At ImagePro, we believe that **Quality Control** is an essential part of this process. As an extra assurance, we run a final visual QC, searching for errors in any part of the chain and helping to catch any outstanding issues so that we can work with you to rectify them at the right time.

Now your DI files are complete and approved!

Please call ImagePro to discuss how we can Vet, Validate & QC your DI assets.
